Supplementary file 4 - Contour-enhanced funnel plots with filled studies according to the Duval and Tweedie's trim-and-fill method.

Contour-enhanced funnel plots including filled studies and adjusted effect sizes estimated by Duval and Tweedie's trim-and-fill method. Effect sizes are shown as the natural logarithm of risk ratios (log(RR) on the x-axes and the logarithm of the respective standard errors (logSE) in the y-axes. Black circles represent studies included in meta-analyses. Gray triangles represent filled studies. The black vertical lines represent the actual effects. The gray vertical lines represent the adjusted effects. Filled studies in the white region of the contour-enhanced funnel plots ($p > 10\%$) suggest publication bias. Filled studies in gray regions of the plots suggest the effects of high heterogeneity, one-sided comparisons, or other causes of funnel plot asymmetry.
