Review question

What are the populations mostly affected by Tuberculosis among refugees

What is the epidemiology of Tuberculosis among Refugees and migrant populations

What is the Prevalence/Incidence of Tuberculosis among Refugees and migrant populations

Types of study to be included

Systematic review. Epidemiological studies and surveillance studies included in the review

Condition or domain being studied

Tuberculosis (TB) is an increasingly important cause of morbidity and mortality among refugee and migrant populations. Refugees and Migrants are among the most vulnerable populations at increased risk of developing TB and of poor access to TB care and control services. Factors including malnutrition, overcrowding, poor living condition, their mobile nature and poor access to health care system increase the vulnerability of these populations. Conflict, poverty, limited resource, political instability and unemployment are the most common cause of large population displacement.

Participants/population

Refugees, persons who are outside their country and cannot return owing to a well-founded fear of persecution because of their race, religion, nationality, political opinion or membership in a particular social group

Migrant populations

Intervention(s), exposure(s)

Tuberculosis

Comparator(s)/control

N/A

Main outcome(s)

The burden of Tuberculosis in the refugee and migrant populations will be reviewed. The main outcomes will be Incidence, prevalence and mortality of Tuberculosis in the five years publication period will be reviewed. We included Tuberculosis Epidemiological studies(Incidence, Prevalence, Survey, notifications) in refugee and migrant populations since 2005 and reported in all age groups.

* Measures of effect

Not applicable

Additional outcome(s)

Tuberculosis Notifications rates and among refugees and migrant populations will be reviewed. The impact of Refugees and migration also reviewed. Factors including malnutrition, overcrowding, poor living condition, their mobile nature and poor access to health care system increase the vulnerability of these populations. Conflict, poverty, limited resource, political instability and unemployment are the most common cause of large population displacement.

Data extraction (selection and coding)

We included Tuberculosis Epidemiological studies (Incidence, Prevalence, Survey, notifications) in refugee and migrant populations since 2005 and reported in all age groups. We excluded before 2014.

Risk of bias (quality) assessment

The quality of the studies selected was assessed independently by two authors (AMD and HHT) using Crombie's tool, which contains seven items for quality assessment. These items were assessed for appropriateness of design, adequacy of data description, representativeness of the total sample, clarity, reliability and validity of the measurements, statistical significance, appropriateness and adequacy of the analyses. The quality of each article was then scored accordingly.

Strategy for data synthesis

Data entry will be done using SPSS version 23 software packages and epidata. Double data entry will be also done using online OpenClinica for data entry and cleaning.

Analysis of subgroups or subsets

Data analysis will be done using STATA ver 14 and results will be interpreted based on 95% confidence

interval, statistically significant if p-value <0.05.
