eAppendix. Results of Risk of Bias Assessment

Seven of nine cross-sectional studies had low risk of bias[1-7] and two had moderate risk.[8,9] Four of eight qualitative studies had low risk of bias[10-13] and four had moderate risk.[14-17] Three of four mixed-methods studies were assessed using both the cross-sectional and qualitative checklist; two had low-moderate risk of bias[18,19] and one had moderate-high risk.[20] The remaining mixed-methods study had low risk of bias after being assessed using the qualitative checklist as it did not incorporate a quantitative survey.[21] Main concerns in cross-sectional quantitative studies were due to sampling (inadequate sample size or no sample size calculation in 10/12 studies, lack of representative samples in 6/12 studies) and inappropriate management of low response rates (5/12 studies). For qualitative studies, concerns were mostly due to lack of acknowledgement of the location of the researcher culturally or theoretically (12/12 studies), as well as their influence on the research (10/12 studies).
