Table S1 The IPDASi criteria applied to the included patient decision aid for GAS in transmen

Items	Present	Absent	N/A
Qualifying criteria			
The patient decision aid describes the health condition or problem (treatment, procedure, or investigation) for which the index decision is required	X		
The patient decision aid explicitly states the decision that needs to be considered (index decision)	X		
The patient decision aid describes the options available for the index decision	X		
The patient decision aid describes the positive features (benefits or advantages) of each option	X		
The patient decision aid describes the negative features (harms, side effects, disadvantages)	X		
The patient decision aid describes what it is like to experience the consequences of the options (e.g., physical, psychological, social)	X		
Certification criteria (strongly disagree 1 to strongly agree 4)			
The patient decision aid shows the negative and positive features of options with equal detail (e.g., using similar fonts, sequence, presentation of statistical information)		4	
The patient decision aid (or associated documentation) provides citations to the evidence selected		1	
The patient decision aid (or associated documentation) provides a production or publication date		1	
The patient decision aid (or associated documentation) provides information about the update policy		1	
The patient decision aid provides information about the levels of uncertainty around event or outcome probabilities (e.g., by giving a range or by using phases such as our best estimate is …")		2	
The patient decision aid (or associated documentation) provides information about the funding source used for development		4	
The patient decision aid describes what the test is designed to measure		4	
If the test detects the condition or problem, the patient decision aid describes the next steps typically taken		N/A	
The patient decision aid describes the next steps if the condition or problem is not detected		N/A	
The patient decision aid has information about the consequences of detecting the condition or disease that would never have caused problems if screening had not been done (lead time bias)		N/A	
Quality criteria (strongly disagree 1 to strongly agree 4)			
The patient decision aid describes the natural course of the health condition or problem, if no action is taken (when appropriate)		2	
The patient decision aid makes it possible to compare the positive and negative features of the available options		4	
The patient decision aid provides information about outcome probabilities associated with the options (i.e., the likely consequences of decisions)		3	
The patient decision aid specifies the defined group (reference class) of patients for whom the outcome probabilities apply		4	
The patient decision aid specifies the event rates for the outcome probabilities		2	
The patient decision aid allows the user to compare outcome probabilities across options using the same time period (when feasible)		2	
The patient decision aid allows the user to compare outcome probabilities across options using the same denominator (when feasible)		2	
The patient decision aid provides more than 1 way of viewing the probabilities (e.g., words, numbers, and diagrams)		2	
The patient decision aid asks patients to think about which positive and negative features of the options matter most to them (implicitly or explicitly)		3	
The patient decision aid provides a step-by step way to make a decision		3	
The patient decision aid includes tools like worksheets or lists of questions to use when discussing options with a practitioner		2	
The development process included a needs assessment with clients or patients		4	
The development process included a needs assessment with health professionals		4	
The development process included review by clients/patients not involved in producing the decision support intervention		2	
The development process included review by professionals not involved in producing the decision support intervention		2	
The patient decision aid was field tested with patients who were facing the decision		4	
The patient decision aid was field tested with practitioners who counsel patients who face the decision		4	
The patient decision aid (or associated documentation) describes how research evidence was selected or synthesized		1	
The patient decision aid (or associated documentation) describes the quality of the research evidence used		1	
The patient decision aid includes authors'/developers' credentials or qualifications		1	
The patient decision aid (or associated documentation) reports readability levels (using 1 or more of the available scales)		1	
There is evidence that the patient decision aid improves the match between the preferences of the informed patient and the option that is chosen		2	
There is evidence that the patient decision aid helps patients improve their knowledge about options' features		2	
The patient decision aid includes information about the chances of having a true-positive test result		N/A	
The patient decision aid includes information about the chances of having a true-negative test result		N/A	
The patient decision aid includes information about the chances of having a false-positive test result		N/A	
The patient decision aid includes information about the chances of having a false-negative test result		N/A	
The patient decision aid describes the chances the disease is detected with and without the use of the test		N/A
