1. *Title* identify the research as a single-case experimental design in the title
2. *Abstract* summarize the research question, population, design, methods, including intervention/s (independent variable/s) and targe behavior/s and any other outcome/s (dependent variable/s), results, and conclusions
3. *Scientific background* describe the scientific background to identify issue/s under analysis, current scientific knowledge, and gaps in that knowledge base
4. *Aims* state the purpose/aims of the study, research question/s, and, if applicable, hypotheses
5. *Design* identify the design (e.g., withdrawal/reversal, multiple-baseline, alternating-treatments, changing-criterion, some combination thereof, or adaptive design) and describe the phases and phase sequence (whether determined a priori or data-driven) and, if applicable, criteria for phase change
6. *Procedural changes* describe any procedural changes that occurred during the course of the investigation after the start of the study
7. *Replication* describe any planned replication
8. *Randomization* state whether randomization was used, and if so, describe the randomization method and the elements of the study that were randomized
9. *Blinding* state whether blinding/masking was used, and if so, describe who was blinded/masked
10. *Selection criteria* state the inclusion and exclusion criteria, if applicable, and the method of recruitment
11. *Participant characteristics* for each participant, describe the demographic characteristics and clinical (or other) features relevant to the research question, such that anonymity is ensured
12. *Setting* describe characteristics of the setting and location where the study was conducted
13. *Ethics* state whether ethics approval was obtained and indicate if and how informed consent and/or assent were obtained
14. *Measures* operationally define all target behaviors and outcome measures, describe reliability and validity, state how they were selected, and how and when they were measured
15. *Equipment* clearly describe any equipment and/or materials (e.g., technological aids, biofeedback, computer programs, intervention manuals or other material resources) used to measure target behavior/s and other outcome/s or deliver the interventions
16. *Intervention* describe the intervention and control condition in each phase, including how and when they were actually administered, with as much detail as possible to facilitate attempts at replication
17. *Procedural fidelity* describe how procedural fidelity was evaluated in each phase
18. *Analyses* describe and justify all methods used to analyze data
19. *Sequence completed* for each participant, report the sequence actually completed, including the number of trials for each session for each case. For participant/s who did not complete, state when they stopped and the reasons
20. *Outcomes and estimation* for each participant, report results, including raw data, for each target behavior and other outcome/s
21. *Adverse events* state whether or not any adverse events occurred for any participant and the phase in which they occurred
22. *Interpretation* summarize findings and interpret the results in the context of current evidence
23. *Limitations* discuss limitations, addressing sources of potential bias and imprecision
24. *Applicability* discuss applicability and implications of the study findings
25. *Protocol* if available, state where a study protocol can be accessed
26. *Funding* identify source/s of funding and other support; describe the role of funders
