

Supplementary Fig. 1. No significant change of seizure recurrence rates (SRRs) after 2 years of follow-up in subgroup analyses by subject age or sleep definition. The SRR was 57.2% in adult studies and 60.8% in pediatric studies (A), and 55.6% in nighttime-definition studies and 62.8% in being-asleep-definition studies (B). CI, confidence interval; FUS-S, first unprovoked seizure while sleeping.
