Supplementary Fig S2. Plots of the inconsistency estimates along with their 95% CI, for all of the primary and secondary outcomes (except the 36-month percentage change of total hip BMD), including the percentage changes of femoral neck BMD at 6 months (A), 12 months (B) and 24 months (C), the percentage changes of total hip BMD at 6 months (D), 12 months (E) and 24 months (F), the percentage changes of lumbar BMD at 6 months (G), 12 months (H) and 24 months (I), 36-month BMD percentage changes at femoral neck (J), and lumbar spine (L), all recorded new fractures (K) and severe adverse events (M). Within each loop inconsistency is estimated assuming a common heterogeneity for each comparison. The amount of heterogeneity is estimated with the method of moments (DL) estimator under the random-effects model. Abbreviations as well as the corresponding description of the interventions are available in Table 2.
