S7 Table. Risk of bias assessment

Author, Year of publication	Study population	Was the study's target population a close representation of the national population in relation to EV-D68 prevalence or CFR?	Was the sampling frame a true or close representation of the target population?	Was some form of random selection used to select the sample, OR was acensus undertaken?	Were data collected directly from the subjects (as opposed to a proxy)?	Was an acceptable inclusion criteria definition used in the study?	Was the response rate ≥ 70 % or not significant different inrelevantdemographic characteristics between responders and nonresponders?	Was the EV-D68 detection assay shown to have reliability and validity?	Was the same mode of data collection used for all subjects?	Was the length of the study period > or = 1 year?	Were the numerator(s) and denominator(s) for the EV-D68 prevalence appropriate?	Risk of bias
