Inclusion and exclusion criteria for studies on risk-reducing surgery:

Articles meeting all of the following criteria were included: 1) The population included women with Lynch syndrome either with a confirmed MMR mutation or who fulfilled Amsterdam II Criteria 2) The intervention was risk-reducing hysterectomy and/or salpingo-oophorectomy 3) The outcome was endometrial or ovarian cancer incidence at the time of risk-reducing surgery in prophylactic specimens 4) The results were histological findings in prophylactic hysterectomy, salpingectomy, or oophorectomy specimens.

Articles meeting any of the following criteria were excluded: 1) The population was not Lynch syndrome carriers but other hereditary cancer syndrome carriers 2) The outcomes were patient perception of the procedure 3) The outcomes were side effects about the procedure 4) The study was a review and not original data 5) The study was about cost-effectiveness of surgery 6) The article summarised guidelines in managing women predisposed to Lynch syndrome with risk-reducing surgery.
