PEER REVIEW HISTORY

BMJ Open publishes all reviews undertaken for accepted manuscripts. Reviewers are asked to complete a checklist review form (**http://bmjopen.bmj.com/site/about/resources/checklist.pdf**) and are provided with free text boxes to elaborate on their assessment. These free text comments are reproduced below.

ARTICLE DETAILS

TITLE (PROVISIONAL)	Non-pharmacological interventions for the prevention of type 2 diabetes in low income and middle-income countries: a systematic review of randomized controlled trials
AUTHORS	Sarker, Anupam; Das, Rina; Ether, Saraban; Shariful Islam, Md; Saif-Ur-Rahman, KM

VERSION 1 – REVIEW

REVIEWER	Mikael Fogelholm University of Helsinki
REVIEW RETURNED	12-Apr-2022

GENERAL COMMENTS	Thank you for the revision. It is good. However, I do apologize for being picky with two points in your responses. You may consider these thoughts: 1) Da Qing study: I am unsure if I would by your reasoning. It is true that the criteria for Da Qing were older and different from what is nowadays used. However, looking at the heterogeneity of your selected studies in terms of diabetes status (Table 1), I would not personally think that Da Qing study would have been an outlier. My humble suggestion (as a compromise) would be to add a a few lines introducing the main findings of Da Qing study in the discussion and compare them to what you otherwise have found. Page 14, last paragraph: USDA Food Pyramid: It's is OK to just note that the use of USDA Food Pyramid is surprising. However, your explanation is unlikely to be true, since USDA Food Pyramid Guide is a food-based, not nutrient based. My suggestion is to leave this reasoning out.

REVIEWER	L Velazquez Lope Mexican Social Security Institute, Investigation
REVIEW RETURNED	09-May-2022

GENERAL COMMENTS	The reported systematic review is interesting. The authors have considered the previous review in this second version. The importance of dietary modification and physical activity in reducing the incidence of diabetes is described. The authors consider the limitations of the review in relation to the number of studies included.

VERSION 1 – AUTHOR RESPONSE

Reviewer: 1
Mikael Fogelholm, University of Helsinki

Comments to the Author:

Thank you for the revision. It is good. However, I do apologize for being picky with two points in your responses. You may consider these thoughts:

1) Da Qing study: I am unsure if I would by your reasoning. It is true that the criteria for Da Qing were older and different from what is nowadays used. However, looking at the heterogeneity of your selected studies in terms of diabetes status (Table 1), I would not personally think that Da Qing study would have been an outlier. My humble suggestion (as a compromise) would be to add a a few lines introducing the main findings of Da Qing study in the discussion and compare them to what you otherwise have found.

Response: Thanks for the insightful comment. We agree with the reviewer. We have mentioned the Da Qing study findings in the discussions as suggested.

Page 14, last paragraph: USDA Food Pyramid: It's is OK to just note that the use of USDA Food Pyramid is surprising. However, your explanation is unlikely to be true, since USDA Food Pyramid Guide is a food-based, not nutrient based. My suggestion is to leave this reasoning out.

Response: Thanks for the pertinent comment. We have omitted the mentioned reasoning.
