S3 Table. Items for risk of bias assessment

Hoy et al. tool for cross sectional studies	**Yes (1)/No (0)**
External validity	
1. Was the study's target population a close representation of the national population in relation to hepatitis B and C viruses prevalence or case fatality rate?	**1**
2. Was the sampling frame a true or close representation of the population?	**1**
3. Was some form of random selection used to select the sample, OR was a census undertaken?	**1**
4. Was the likelihood of non-response bias minimal?	**1**
Internal validity	
5. Were data collected directly from the subjects (as opposed to a proxy)?	**1**
6. Was an acceptable case definition used in the study?	**1**
7. Was the study viral detection assay shown to have validity and reliability?	**1**
8. Was the same mode type of sample collected for all subjects?	**1**
9. Was the length of the length of the study period > 1 year?	**1**
10. Were the numerator(s) and denominator(s) for the prevalence or case fatality rate of hepatitis B and C viruses appropriate?	**1**
Total score	**10**
Interpretation of the risk of bias tool • 7-10: Low risk of bias • 4-6: Moderate risk of bias • 0-3: High risk of bias
