Supplementary Content 3: Modified Newcastle-Ottawa Assessment Scale

Selection		
1	Is the study population likely to be representative of the whole population?	
2	Does the study specify the source of data?	
3	Was the sample size appropriate or was there a sample size calculation or power analysis performed to determine adequate sample size?	
4	Are inclusion and exclusion criteria clearly outlined?	
5	Is the study population specifically sought for the purpose of the study i.e. no part of a larger shared database?	
6	Is the data range of the data set clearly stated?	
Comparability		
7	Did the study include a control group?	
8	Is the research methodology clearly stated?	
9	Is the data collection methodology clearly stated?	
10	Is the statistical methodology appropriate?	
11	Does the study detail the indication/etiology of the patient cohort?	
12	Does the study report mortality?	
13	Did the detail the ECG analysis performed?	
14	Did the study discuss the definition of ventricular arrhythmia and arrhythmic death?	
Outcome		
15	Are the outcomes clearly stated and discussed in relation to the data collection?	
16	Does the study report findings in relation to original aims?	
17	Was the follow-up time defined and adequate for clinical relevance?	
18	Were the differences between groups clinically meaningful? (was the clinical significance reported)	
19	Does the study account for cofounding factors and is it considered in the analysis? (i.e. Multivariable logistic regression analysis)	
20	Does the study report fQRS in different ECG leads (i.e. inferior, anterior, lateral)?	

Score	/20
Low quality	<10
Moderate quality	10-15
High quality	>15
