S5 Table. Risk of bias assessment

Author	Was the study's target population a close representation of the national population in relation to LASV prevalence?	Was the sampling frame a true or close representation of the target population?	Was some form of random selection used to select the sample, OR was a census undertaken?	Were data collected directly from the subjects (as opposed to a proxy)?	Was an acceptable case definition used in the study?	Was the response rate ≥ 70 % or not significant different in relevant demographic characteristics between responders and nonresponders?	Was the CCHF detection assay shown to have reliability and validity?	Was the same mode of data collection used for all subjects?	Was the length of the study period >= 1 year?	Were the numerator(s) and denominator(s) for the CCHFV prevalence or case fatality rate appropriate?	Species	Risk of bias
