PEER REVIEW HISTORY

BMJ Open publishes all reviews undertaken for accepted manuscripts. Reviewers are asked to complete a checklist review form (**http://bmjopen.bmj.com/site/about/resources/checklist.pdf**) and are provided with free text boxes to elaborate on their assessment. These free text comments are reproduced below.

ARTICLE DETAILS

TITLE (PROVISIONAL)	Working towards a comprehensive understanding of HPV and cervical cancer amongst Indigenous women: A qualitative systematic review
AUTHORS	Sethi, Sneha; Poirier, Brianna; Canfell, Karen; Smith, Megan; Garvey, Gail; Hedges, Joanne; Ju, Xiangqun; Jamieson, Lisa M.

VERSION 1 – REVIEW

REVIEWER	Christie, Vita The University of Sydney, Poche Centre for Indigenous Health
REVIEW RETURNED	23-Mar-2021

GENERAL COMMENTS	Minor revision: I find the point about community driven solutions hard to follow (lines 477-480 of the text). If there was only study that looked community driven solutions, it does not logically follow that this is therefore of importance. Though we know this to be true, only one study presenting these indicates that the literature has not looked at this enough. Overall: this is a comprehensive and thoughtful look at what emerges from the existing literature. The introduction sets the scene in an articulate manner and the tools used encourage relevant themes to be played out properly.

REVIEWER	Shetty, Ranjitha Kasturba Medical College Manipal, Department of Community Medicine
REVIEW RETURNED	06-Apr-2021

GENERAL COMMENTS	Comments to the authors This manuscript focuses on a relevant issue exploring the experiences of indigenous women and health care workers in the context of HPV infection, cervical cancer and screening methods. This is crucial in prevention and control of this chronic disease, especially in developing countries. Research question is relevant as cancer is one of the major public health concerns especially in developing countries and indigenous women are more prone for these infections and cancer. Authors have written the objectives of the study clearly. Abstract gives the summary of the manuscript in a concise manner. However, there are few concerns with respect to this manuscript which need to be addressed by the authors.

	This manuscript has many typos or grammar errors, so please get the manuscript reviewed by an English editor. (ex: Peoples to be replaced by people; Indigenous could be written as indigenous) Introduction Authors have not mentioned about studies done in the context of indigenous/ tribal women. They need to mention about the prevalence of HPV and other cervical infections and awareness about HPV infection and cervical cancer screening among indigenous women by referring to available studies across the globe. 1. https://doi.org/10.1371/journal.pone.0219173. 2. https://doi.org/10.1007/s40615-020-00760-4. Methodology Authors have not mentioned from which all places the studies were included. If there is no such criteria, even then they need to mention that studies from across the world were included(though it has been mentioned in Table 1 but not in the methods text).

REVIEWER	McGregor, Skye University of New South Wales, Kirby Institute
REVIEW RETURNED	20-Apr-2021

GENERAL COMMENTS	This paper was a pleasure to read and provides a valuable summary of available qualitative evidence of the experience of Indigenous women in relation to HPV. The authors have provided clear documentation of their adherence to established protocols for conducting systematic reviews and provided highly detailed and nuanced results, including evidence of community generated solutions. The Social Ecological Model provides a great framework for positioning the findings. The team have recognised the limitations of English only, a dominance of Canadian data, and female only literature. It would be good to see future work expanded to this and grey literature. I only have very minor revisions, as follows: Abstract: Line 47-50 consider splitting into two more concise sentences, for readability Materials and Methods: Line 179 - why only single out genotype HPV 18? Critical appraisal: Line 201, it would be good to include a reference to the JBI SUMARI tool Table 3: Line 30, Allen-Leigh summary - sample size is in the first column, but missing from the final column Butler summary - headings missing from final column i.e. Participant characteristics, sample size Page 55 - PRISMA flowchart - Using the numbers provided a total of 11 papers is left for the 'Included studies' box (10 as per Table 3 and text) - it is not clear where the additional paper should be excluded from? S4: It was not clear with the (C) (U) etc in the 'Finding' column stood for in the table? The formatting was also inconsistent with some papers have the higher level Finding in brackets, followed by

	the specific example out of brackets and vice versa for other papers. Page 17, line 49 - type 'slef sampling' should be 'self sampling' References: Add a date of access for web links

VERSION 1 – AUTHOR RESPONSE

Reviewer 1
Reviewer Comment: Minor revision: I find the point about community driven solutions hard to follow (lines 477-480 of the text). If there was only study that looked community driven solutions, it does not logically follow that this is therefore of importance. Though we know this to be true, only one study presenting these indicates that the literature has not looked at this enough.

Reviewers Comment: Overall: this is a comprehensive and thoughtful look at what emerges from the existing literature. The introduction sets the scene in an articulate manner and the tools used encourage relevant themes to be played out properly.
Author comment: I thank the reviewer and appreciate the effort and time dedicated for reviewing our manuscript.

Reviewer: 2

Reviewer comment: This manuscript focuses on a relevant issue exploring the experiences of indigenous women and health care workers in the context of HPV infection, cervical cancer and screening methods. This is crucial in prevention and control of this chronic disease, especially in developing countries. Research question is relevant as cancer is one of the major public health concerns especially in developing countries and indigenous women are more prone for these infections and cancer. Authors have written the objectives of the study clearly. Abstract gives the summary of the manuscript in a concise manner.
However, there are few concerns with respect to this manuscript, which need to be addressed by the authors.
This manuscript has many typos or grammar errors, so please get the manuscript reviewed by an English editor. (ex: Peoples to be replaced by people; Indigenous could be written as indigenous)
Author comment: All comments have been addressed except for the suggestion to replace Indigenous with indigenous and Peoples with people. Many guidelines and policies reflecting respectful terminology for Indigenous Peoples exist (please see for example: https://www.actcoss.org.au/sites/default/files/public/publications/gulanga-good-practice-guide-preferences-terminology-referring-to-aboriginal-torres-strait-islander-peoples.pdf; https://www.phaa.net.au/documents/item/4897). The plural use of Peoples reflects the many Indigenous communities included in this review.

Reviewers comment: Introduction - Authors have not mentioned about studies done in the context of indigenous/ tribal women. They need to mention about the prevalence of HPV and other cervical infections and awareness about HPV infection and cervical cancer screening among indigenous women by referring to available studies across the globe.

Author comment: Done

Reviewers comment: Methodology : Authors have not mentioned from which all places the studies were included. If there is no such criteria, even then they need to mention that studies from across the

world were included(though it has been mentioned in Table 1 but not in the methods text).
Authors Comment: Done

Reviewer: 3

Reviewer comment: This paper was a pleasure to read and provides a valuable summary of available qualitative evidence of the experience of Indigenous women in relation to HPV. The authors have provided clear documentation of their adherence to established protocols for conducting systematic reviews and provided highly detailed and nuanced results, including evidence of community generated solutions. The Social Ecological Model provides a great framework for positioning the findings. The team have recognised the limitations of English only, a dominance of Canadian data, and female only literature. It would be good to see future work expanded to this and grey literature. I only have very minor revisions, as follows:
Abstract: Line 47-50 consider splitting into two more concise sentences, for readability
Author Comment: Done.

Reviewers comment: Materials and Methods: Line 179 - why only single out genotype HPV 18?
Author comment: HPV 18 was not singled out intentionally, but it emerged as a strong Mesh word in our searches. Inclusion of this specific term was purely to maximise the chances of inclusion of all relevant articles.

Reviewers comment: Critical appraisal: Line 201, it would be good to include a reference to the JBI SUMARI tool
Author comment: Done.

Reviewers comment: Table 3: Line 30, Allen-Leigh summary - sample size is in the first column, but missing from the final column
Authors comment: Done

Reviewers Comment: Butler summary - headings missing from final column i.e. Participant characteristics, sample size
Author Comment: Done

Reviewers comment: Page 55 - PRISMA flowchart - Using the numbers provided a total of 11 papers is left for the 'Included studies' box (10 as per Table 3 and text) - it is not clear where the additional paper should be excluded from?
Authors comment: This was a typographical error. The inclusion of the 11th article presented as a conflict among authors due to various reasons. But was finally decided to be excluded. Thank you for your keen observation. I have edited the figure to match the text and Table 3 now.
S4: It was not clear with the (C) (U) etc in the 'Finding' column stood for in the table? The formatting was also inconsistent with some papers have the higher level Finding in brackets, followed by the specific example out of brackets and vice versa for other papers.
The C and U coding has been explained in the data extraction and synthesis section of the main file. It depicts the Unequivocal (U), Credible (C) and Not Supported (NS) rating of each phrase. This rating was done by two authors (SS and BP) in accordance with the JBI SUMARI guidelines, as referenced and explained in the main file.
I have corrected the formatting and bracket placement within the table of S4.

VERSION 2 – REVIEW

REVIEWER	McGregor, Skye University of New South Wales, Kirby Institute
REVIEW RETURNED	08-Jun-2021

GENERAL COMMENTS	Thank you for your responses to initial review. I am happy with the revisions and clarifications, but would also recommend a footnote explaining the coding in S4, so it can be read as a standalone table.
