PEER REVIEW HISTORY

BMJ Open publishes all reviews undertaken for accepted manuscripts. Reviewers are asked to complete a checklist review form (**http://bmjopen.bmj.com/site/about/resources/checklist.pdf**) and are provided with free text boxes to elaborate on their assessment. These free text comments are reproduced below.

ARTICLE DETAILS

TITLE (PROVISIONAL)	Evaluation of the psychometric properties of patient-reported and clinician-reported outcome measures of chemotherapy-induced peripheral neuropathy: a COSMIN systematic review protocol
AUTHORS	Bérubé-Mercier, Philippe; Tapp, Diane; Cimon, Marie-Ève; Li, Tiffany; Park, Susanna; Bouhêlier, Éve; McGarragle, Kaitlin; Robichaud, Lye-Ann; Gewandter, Jennifer; Bouchard, Maxime; Gauthier, Lynn

VERSION 1 – REVIEW

REVIEWER	Riva, Silvia St Mary's University
REVIEW RETURNED	29-Dec-2021

GENERAL COMMENTS	Dear authors, Thank you for the opportunity to read this interesting protocol. The manuscript is well written, very clear, and structured according to the PRISMA guidelines. I do not have any specific comments or suggestions for you except one minor (and personal) thought. Outcome measures for chemotherapy-induced peripheral neuropathy are important and can provide very useful information for patient management. In my opinion, research is moving in a wider perspective where not only PROs measures are taken into account but also PREMs (Patients Reported Experience Measures) are considered. While Patient-reported outcome measures (PROMs) are questionnaires measuring the patients' views of their health status, patient-reported experience measures (PREMs) are questionnaires measuring the patients' perceptions of their experience whilst receiving care. PREMs data can be used for: research, quality improvement projects, clinician performance evaluation, audit, and economic evaluation. I understand how difficult is to include PREMs (e.g.the COSMIN Checklist does not mention PREMs). However, I think this represents a point of discussion for future research in this field. Just a point to mention in your future discussion!

VERSION 1 – AUTHOR RESPONSE

Dr. Silvia Riva, Reviewer 1: Comment 1: *In my opinion, research is moving in a wider perspective where not only PROs measures are taken into account but also PREMs (Patients Reported Experience Measures) are considered. While Patient-reported outcome measures (PROMs) are questionnaires measuring the patients' views of their health status, patient-reported experience*

measures (PREMs) are questionnaires measuring the patients' perceptions of their experience whilst receiving care. PREMs data can be used for: research, quality improvement projects, clinician performance evaluation, audit, and economic evaluation. I understand how difficult is to include PREMs (e.g.the COSMIN Checklist does not mention PREMs). However, I think this represents a point of discussion for future research in this field. Just a point to mention in your future discussion!

Response: We have modified the subtitle and content of the previous Discussion section to more fully reflect the strengths and limitations and the mitigation strategies to be used.

We thank Dr. Riva for her insightful comments about the value of PREMs. We agree with Dr. Riva about the difficulty of including PREMs given that the COSMIN checklist does not currently include PREMS, and we wholeheartedly agree that high quality CIPN PREMs are needed to improve patient health outcomes and the quality of care for those undergoing chemotherapy or receiving CIPN treatment. We have noted this in the Strengths, Limitations and Mitigation Strategies section, calling for future research to identify and evaluate the quality of CIPN PREMs and an expansion of the COSMIN methodology to include PREMs (bottom page 12 – top page 13). We have also added this limitation in the Strengths and Limitations section in the abstract (page 3, para 1). We will be sure to include these important ideas in the future paper's Discussion section.
