Appendix B: Title and abstract level and full-text level inclusion and exclusion criteria

	Include	Exclude
Title and abstract level	**Population**: Individuals experiencing SLE or related conditions (general arthritis, autoimmune conditions) – as these articles may include subgroup analysis of people with SLE. **Population**: Humans **Population**: Any age, any sex, and any ethnicity **Outcome**: Includes description of concept related to health-related quality of life (HRQoL), health status, or social role participation **Design**: Quantitative **Design**: includes cognitive construct/measure as a predictor of outcomes	**Population**: Not SLE or related conditions with no SLE sub-group analysis . Exclusion examples: ● Rheumatoid Arthritis ● Scleroderma ● Psoriatic arthritis ● Only fibromyalgia **Population**: Non-humans **Concept**: Only identified outcome is organ or body system level **Design**: Qualitative or mixed-methods; systematic reviews *(although these reviews will be scanned for possible related primary studies)* **Design:** does not include cognitive construct/measure as a predictor of outcomes. If it seems vague about predictors, include
Full-text level	**Population**: SLE diagnosis for some or all participants. If more than one population is in study, results must include SLE-specific analysis **Outcome**: Quantitative health-related quality of life (HRQoL), health status, and social role participation level data **Design**: Quantitative Design: includes cognitive construct/measure as a predictor of outcomes	**Hierarchy/ order of exclusion**: 1. Article not in English 2. Full- text article not available (i.e. abstract from conference or unable to find article using several different databases) 3. Not peer-reviewed published evidence (i.e. grey literature, book chapter, magazine article) 4. Not primary evidence: Opinion or non-empirical publication or is a review. 5. **Population**: non-human study 6. **Population**: no SLE specific analysis (total group not SLE or no SLE sub-group

	analysis) 7. **Study design**: Not quantitative design 8. **Study design**: Does not use a measure of cognition (subjective or objective) as a predictor) 9. **Outcome**: does not include outcome of social role participation, health-related quality of life (HRQoL) or health status 10. Study included in 2018 search and overlapped in 2020 search.
