Bibliotherapy as a non-pharmaceutical intervention to enhance mental health in response to the COVID-19 pandemic: A mixed-methods systematic review and bioethical meta-analysis

Table 1S Codes and operational definition

CODE	Operational definition	CODE	Operational definition	CODE	Operational definition
Honesty	Is the complete disinterested presentation of information	**Charity**	Disinterested gift for the sake of another	**Only experimental**	When there was not a control group to compare to
Veracity	It is the capacity of expressing truthfully	**Purity**	Strictly acting under professional principles	**Participants**	When the study mentioned the characteristics and number of participants in the study
Fidelity	Attitudes that generate a confidence bond	**Beauty**	Capacity of recognize beauty standards	**Not relevant**	When a result from the study was not relevant

			according to a personal cosmovision		
Justice	Disposition to give each what is deserved	**Bibliotherapy**	When the study mentions bibliotherapy as an intervention.	**Positive**	When the result of the intervention was positive
Autonomy	This value refers to the ability of self-regulating one's own behavior	**Mental disorder**	When a targeted mental disorder was mentioned in the study	**Without differences**	When the intervention showed no differences between groups or situations
Liberty	The possibility of performing considering one´s own goals	**Sub-clinical problem**	When a sub-clinical problem was mentioned such as sadness, stress, happiness	**Descriptive**	When the result was only descriptive
Equality	Process of balance between two elements	**Survey**	When the study was about a survey and not a clinical trial		
Respect	A positive response and recognition of others' agency, identity and personhood	**Used instrument**	A instrument mentioned in the article		

Tolerance	It is a positive response and a recognition of other´s behavior	**Sample**	When the article specified the sample, who participated
Interest	Disposition to generate a link with one another	**Control-experimental**	If the study design compared a control group versus experimental group
Love	Capacity of affection that one can give to another person	**Experimental-experimental**	If the study design compared two different experimental groups
Service Attitude	Significant efforts made favoring the patients' care	**Treatment as usual-experimental**	When an experimental intervention was compared to a usual intervention

Table 2S Families and codes of analysis

Families			
Values	**Themes**	**Methodological elements of the study**	**Conclusions and results**
Honesty	Bibliotherapy	Survey	Not relevant
Veracity	Mental disorder	Used instrument	Positive
Fidelity		Sample	Without differences
Justice	Sub-clinic problem	Control-experimental	Descriptive
Autonomy		Experimental-experimental	
Liberty		Treatment as usual-experimental	
Equality			
Respect		Only experimental	
Tolerance		Participants	
Interest			
Love			

Service Attitude

Charity

Purity

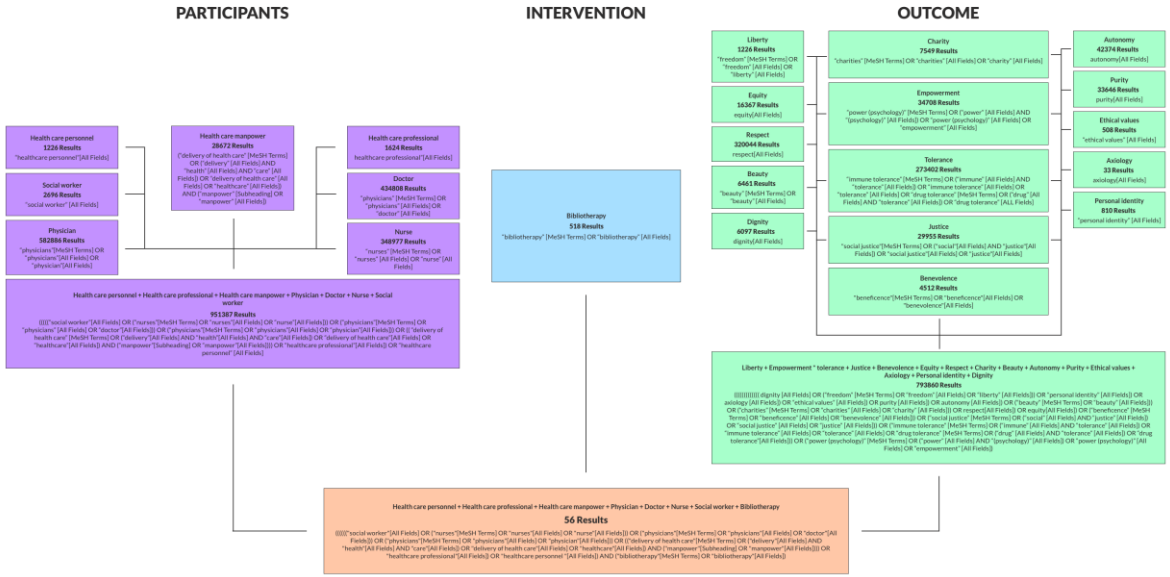
Beauty


Fig 1S. It depicts the search strategy using the PIO model where P stands for Participants, I for Intervention, and O for Outcome. We defined the following keywords for participants: healthcare personnel, healthcare professional, healthcare manpower, physician, doctors, nurse, and social worker. The keywords for intervention were: bibliotherapy. And finally, the keywords for outcome were liberty, empowerment, tolerance, justice, benevolence, equity, respect, charity, beauty, autonomy, purity, ethical values, axiology, personal identity, and dignity. The figure describes the obtained results in each combination.
