Supplementary Table 2: National Institute of Health Quality Assessment Tool for Observational Cohort and Cross-Sectional Studies ratings for included studies

Study	Was the research question or objective in this paper clearly stated?	Was the study population clearly specified and defined?	Was the participant rate of eligible persons at least 50%?	Were all the participants selected or recruited from the same or similar populations (including the same time period)? Were inclusion/exclusion criteria prespecified and applied uniformly?	Was a sample size justification, power description, or variance effect estimates provided?	For the analyses, were the exposure(s) of interest measured prior to the outcome(s) being measured?	Was the timeframe sufficient so that one could reasonably expect to see an association between exposure and outcome if it existed?	For exposures that can vary in amount or level, did the study examine different levels of the exposure as related to the outcome?	Were the exposure measures clearly defined, valid, reliable, and implemented consistently across all participants?	Was the exposure assessed more than once over time?	Were the outcome measures clearly defined, valid, reliable, and implemented consistently across all participants?	Were the outcome assessors blinded to the exposure status of participants?	Was loss to follow-up after baseline 20% or less?	Were key potential confounding variables measured and adjusted for statistically?	Quality Rating
