S2 Appendix. Analysis of other systematic reviews of asymptomatic SARS-CoV-2 infection

First author, publication year [ref]	Studies included, n	Search dates	Inclusion criteria[a]	Summary estimate[b] (95% CI)	I^2	τ^2	Prediction interval
Byambasuren 2020 [1]	13	Until 20 July 2020	"…primary studies on asymptomatic prevalence in which (1) the sample frame includes at-risk populations and (2) follow-up was sufficient to identify pre-symptomatic cases"	18% (11% - 27%)	81%	0.68	3% - 59%
Beale 2020 [2]	21	Until 25 August 2020	"…studies based in community settings that involved systematic PCR testing on participants and follow-up symptom monitoring regardless of symptom status."	21% (13% - 33%)	86%	1.59	2% - 80%
Chen 2021 [3]	241	Until 31 December 2020	"Original investigations with sample size (or number of subjects) not less than five were included for further analyses."	20% (17% - 23%)	99%	2.35	1% - 83%
Ma 2021 [4]	95[c]	Until 4 February 2021	"Cross-sectional studies, cohort studies, case series studies, and case series on transmission reporting the number of asymptomatic infections among the tested and confirmed COVID-19 populations that were published in Chinese or English were included."	51% (42% - 60%)	97%	2.80	4% - 97%
	77[d]			38% (32% - 44%)	97%	1.26	6% - 85%
Sah 2021 [5]	170	Until 2 April 2021	"Studies that reported silent infections at the time of testing, whether presymptomatic or asymptomatic. Index cases were removed to minimize representational bias that would result in overestimation of symptomaticity."	36% (31% - 41%)	94%	1.90	3% - 89%

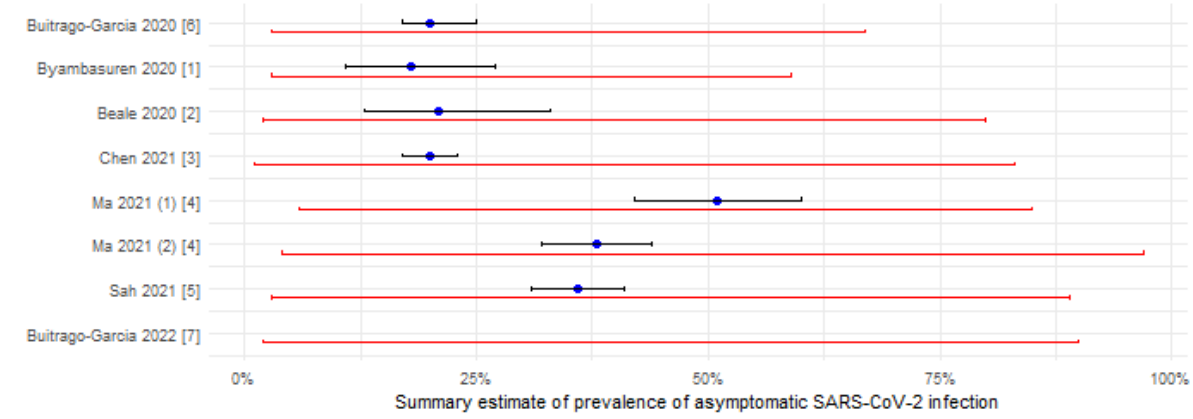
[a] Text extracted from study abstract;

[b] Using the random effects model and the logit transformation to calculate a summary estimate in the *metaprop* package in R. All studies published summary estimates, 95% CI, and I^2 values using their own methodology. Only one study (Beale) published a τ^2 value. None of the studies published a prediction interval;

[c] Including all studies (stratum 1 in the Figure);

[d] Excluding studies in which all cases were asymptomatic (stratum 2 in the Figure).

Figure. Graphical representation of summary estimates of asymptomatic SARS-CoV-2 infection extracted from other systematic reviews



Summary estimate as reported by authors is blue with black lines indicating the 95% confidence interval.
Prediction interval, calculated from study data, represented as red line.

(1) Including all studies
(2) Excluding studies in which all cases were asymptomatic.
