Appendix 1. Summary of the different types of facemasks included in the review and their intended uses

Type of face mask/covering	Description and Intended use
Surgical mask[1, 2]	- Loose-fitting, disposable device, made in different thicknesses - Creates a physical, protective barrier between the mouth and nose of the wearer and potential contaminants in the immediate environment i.e. splashes, sprays, large droplets or splatter. - Primarily intended to prevent the wearer from spreading respiratory droplets - Intended for single use - Does not filter or block very small particles, gases or chemicals in the air that may be transmitted by coughs, sneezes, or certain medical procedures. - Do not provide complete protection from germs and other contaminants because of the loose fit between the surface of the mask and the face.
N95 mask[2, 3]	- Respiratory protective device designed to achieve a very close facial fit. The edges of the respirator are designed to form a seal around the nose and mouth. - Require fit-testing and must be adjusted to the face. - Intended to help reduce wearer exposure to airborne particles as well as larger droplets and protect the wearer from splashes and sprays. - Filters out very fine particles. - Commonly used in healthcare settings. - Should not be shared or reused.
Non-medical face masks/covering[4]	- Cloth face coverings are only intended to help contain the wearer's respiratory droplets from being spread. - At least 2-3 layers needed to block respiratory droplets. - Not intended for use in a clinical setting or explicitly to prevent the transmission of disease between persons. - Some are reusable, and need to be washed after each use.
